Please note that most dimensions of our products are based off of "Inside Dimensions" as they are usually the critical measurements when it comes to the item that requires protection.

For proper fitment it is recommended there be a minimum of 1" of clearance around the item that requires protection. Please note: Any water shut-off valves, wall brackets, faucets, pipe brackets, electrical plugs, or any other miscellaneous item may require additional clearance to facilitate installation or proper operation.

It is not uncommon to lose track of where your item locations are from point of ordering to point of receiving product and installing. It is recommended to number locations with a piece of tape or use numbered stickers to ease in finding the proper location at time of install.

All measurements, layout, lefts and right hand versions, offsets, and corner orientations are taken from the perspective of standing directly in-front of the item requiring protection while facing it.

If for whatever reason you don't see a product that meets your needs or you need clarification regarding details, measurements, or layout please feel free to contact us at sales@proguardpacific.ca or (604) 941-6250.
